

## SAPAG

**A full range of API 526 flanged safety relief valves for process applications, gas, steam and liquid.**

### Features

- Full compliance to API RP 520 and standards 526, 527.
- Certified ASME Section VIII on air, steam and water.
- TÜV approved (AD Merkblatt A2).
- Forged Integral inlet nozzle.
- High flow coefficient.
- Top guided nozzle.
- Easy blowdown adjustment.
- Swivel disc.
- Blow out proof body to bonnet gasket.
- Special "Hightemp" trim for steam applications.
- NACE Compliance.

**8100:** Gas and Steam service.

**8200:** Liquid service.

### Scope

Size : 1" to 12" inlet

Orifice D (0.71cm<sup>2</sup>) to W (393 cm<sup>2</sup>)

Set pressure 0.5 bar to 414 bar

Conventional or balanced bellows

Metal to metal seat or soft seat

Carbon Steel, Stainless Steel, Duplex,

Monel etc...

### Connections

Safety relief valve connections are available in ASME-ANSI flange standards as well as DIN. Other standards may be manufactured on request.

### Series 8100/8200 High Performance Safety Relief Valves

The type 8100 is a flanged, spring loaded, full lift, adjustable blowdown, integral nozzle safety relief valve designed according to API Std 526.

The type 8200 is the "liquid" version of the type 8100.

It is available in 14 orifice sizes, "D" through "T", plus two extra large orifices designated "V" and "W".

The pressure range is from less than one bar up to 414 bar, pressure rating from Cl.150 lbs to Cl.2500 lbs.

The performance of the types 8100/8200 is certified by independent bodies:

- "UV" stamp (National Board certification according to the rules of the ASME Code, section VIII), with capacities certified on air, steam and water
- TÜV approval
- Other approvals (ask the factory for details).

## Conventional type 8100

Most of the applications on gas or vapours are covered by the conventional type 8100. It is available in many different materials for high or low service temperature, as well as stainless steel for corrosive service. Available part lists are published in pages 5 to 8, however special materials may be manufactured upon request. Contact the factory for assistance.

## Steam service type 8100.V0/V1/V2/V3

The 8100.V's series have been developed from the 8100 series for steam applications. The Type 8100.V0 is an open bonnet, plain lifting lever, alloy steel spring design, suitable for steam applications not exceeding 300°C.

The Type 8100.V3 is also an open bonnet, plain lifting lever, alloy steel spring design, using a special high temperature trim : Flexible "HIGHTEMP" " disc made from a high strength martensitic stainless steel grade and a Nickel-Copper alloy guide. The Type 8100.V3 can be used up to 427°C.

When the valves are discharging into a closed system, closed bonnet designs 8100.V1 or .V2 must be used. Both valves feature the special high temperature trim and can be used with a balancing bellows when necessary.

Feature	8100.V0	8100.V3	8100.V1	8100.V2
Bonnet	open	open	closed	closed
Lift lever	plain	plain	packed	packed
Spring	alloy steel	alloy steel	alloy steel	tungsten alloy
Disc	standard	"hightemp"	"hightemp"	"hightemp"
Guide	stainless steel	nickel copper alloy	nickel copper alloy	nickel copper alloy
Bellows	not available	not available	8190.V1	8190.V2
Maxi t°	300°C	427°C	300°C	427°C

## High temperature service type 8120

The type 8120.WC6 is to be used on high temperature service between 428 and 538°C. This design includes CrMo alloy body and bonnet and Tungsten alloy or Ni-Cr alloy spring.

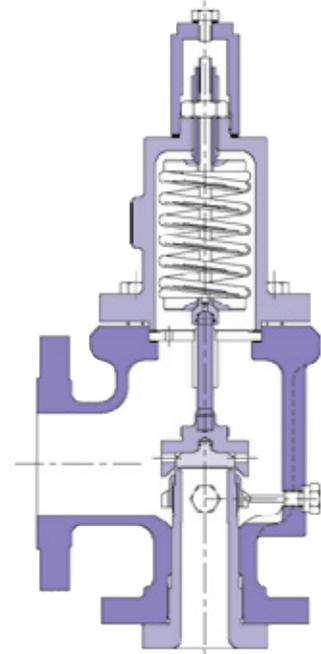

For extremely high temperature, up to 815°C, the type 8120.T2 with an open bonnet, Tungsten alloy or Ni-Cr alloy spring, austenitic CrNiMo stainless steel casing and 25%Cr-20%Ni alloy trim shall be used.

When modified with balancing bellows, 8120 series become 8150.

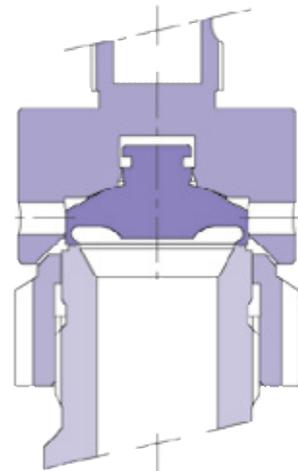

## High temperature service

Service temperature	Open bonnet	Closed bonnet	Closed bonnet & bellows
< 300°C	8100.V0	8100.V1	8190.V1
< 427°C	8100.V3	8100.V2	8190.V2
< 538°C		8120.WC6	8150.WC6
< 815°C	8120.T2		

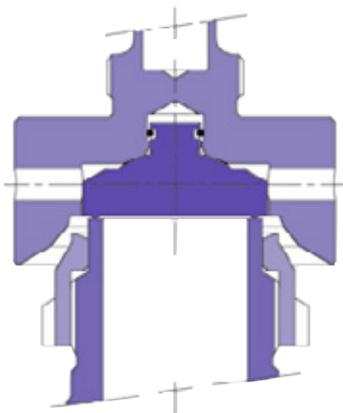

## Conventional Type 8100

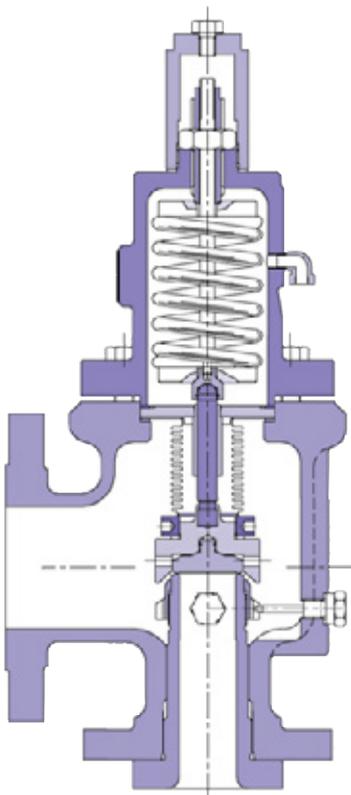

## Flexible "High temp" Disc

### Liquid Trim Type 8200

### Liquid Trim Balanced Type 8190

#### Liquid service type 8200/8290

The type 8200 has been developed from the type 8100 for full liquid relief applications. The patented flow profile of the trim allows the valve to go to full lift at 10% overpressure and eliminates the risk of chattering or hammering often observed when using ordinary safety relief valves on liquid application. No dampening device is required.

The certified flow coefficient at not more than 10% overpressure is  $KD=0.799$ . This very high value allows significant saving in valve sizing. In comparison, a non-certified valve sized according to API 520 would be affected by a flow coefficient of 0.62 multiplied by an overpressure factor of 0.6. Liquid trim should be applied to full liquid operation, two phase flow or when flashing occurs. The type 8290 is a balanced bellows version of the liquid trim design.

#### Balanced bellows type 8190

Balanced bellows safety relief valves shall be used in either of the two following cases :

1. When a valve discharges into a closed system, a variable back pressure (for example due to the relief of another valve discharging into the same header) can occur. This superimposed variable back pressure needs to be balanced in order to avoid unstable valve operation. However a built up back pressure not exceeding 10% of the set pressure is generally considered acceptable with a non balanced (conventional) design.
2. When the valve is handling an aggressive or corrosive fluid and it is desirable to protect the upper part and mechanism of the valve against the medium. The bellows then acts as a chemical shield.

The type 8190 is a truly balanced bellows valve, i.e. the effective area of the bellows is equal to the seating area of the disc, thus allowing the valve to have an opening pressure independent from the back pressure.

In order to get truly balanced valves in the small sizes (orifices "D" and "E"), SAPAG offers as a standard a larger orifice size ("F") with a restricted lift to compensate and flow a "D" or "E" orifice size flow rate, respectively.

All balanced bellows valves must have their bonnet vented to atmosphere to remain truly balanced. Standard bellows are 316L stainless steel; other materials such as INCONEL or MONEL are also available.

A conventional 8100 valve can be converted into a balanced 8190 with a minimum number of additional components.

## Soft seated type 8110/8180

### 'O' Ring seat seal:

The 8110 soft seated safety relief valve design combines a metal to metal seat to absorb the spring load between the disc and the nozzle, and a 'O' Ring resilient soft seal. The design of the soft seal housing is such that the system pressure maintains the 'O' Ring on the seating surface, thus improving the tightness of the valve, even at a pressure very close to the set pressure.

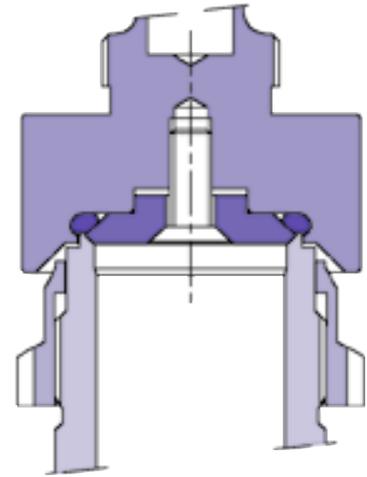

The 8110 soft seated construction is particularly recommended in the following applications:

- where a tightness better than metal to metal is required
- when the operating pressure is more than 92% of the set pressure.
- when handling fugitive, corrosive or soiled media (with an appropriate selection of the 'O' Ring material);
- when the valve is used on vessels operating normally under vacuum, to avoid the penetration of atmospheric air into the system.
- when the system generates vibrations and pressure transients very close to the set pressure.

A 8100 valve can easily be converted into a 8110 soft seated version.

The type 8180 is a soft seated balanced bellows safety relief valve.

Types 8110 and 8180 are available in class Cl.150 and Cl.300 corresponding to model number 8111/8181 and 8113/8183, respectively.

Detail of 'O' Ring seat design option

### PTFE Soft seated valves for cryogenic applications

For cryogenic service, a PTFE soft seated version has been developed of the 8110/8180 series; this model consists of a valve where the regular disc has been replaced by a solid virgin PTFE plug. This design is particularly suitable for Liquid Natural Gas service and guarantees premium tightness performance after many valve operations. This design is limited to moderate pressure values.

### Soft seat material selection

Extreme attention is drawn on a proper selection of the soft material to use. Such parameters are :

- compatibility of the soft material with the medium ;
- soft material temperature limitation in continuous service ;
- aging of the soft material in the medium at the service temperature

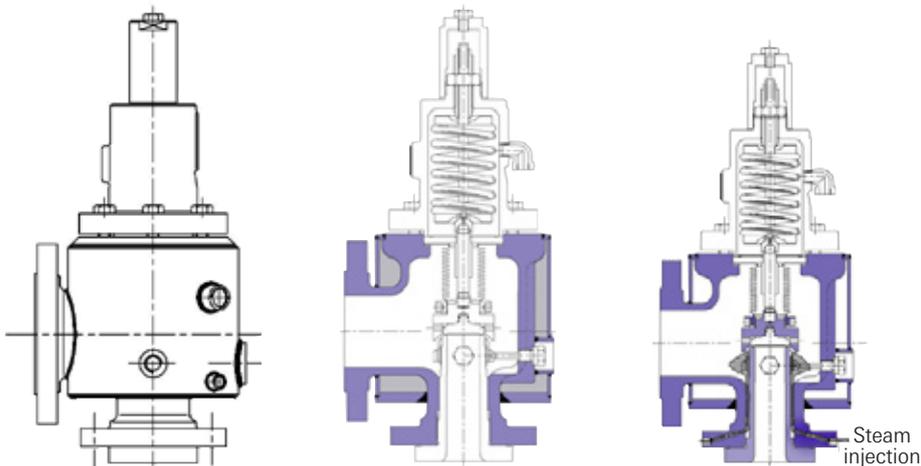

These issues must be taken into careful consideration. No one knows the behavior of soft material in the fluid better than the user whom needs to be consulted prior to the final selection. Most of the applications are covered by Fluorocarbon (VITON®) 'O' Rings as indicated on the following table. The manufacturer designation refers to the valve codification system, see Page 11. For special applications or other soft goods, consult the factory.

### Soft good selection table

Soft seat material	SAPAG designation	Typical application	Temperature range
Fluorocarbon	code «P»	General	-25 to +200°C
Kalrez®	code «V»	Severe service	max. 280°C
EPT	code «K»	Steam	Saturation
PTFE	code «R»	LNG	cryogenic
Nitrile	code «T»	Hydrocarbon	-40 to +120°C

### Note

Information on this table should be considered only as a guide. Compatibility of the selected material with the medium in service conditions has to be carefully considered by the user.

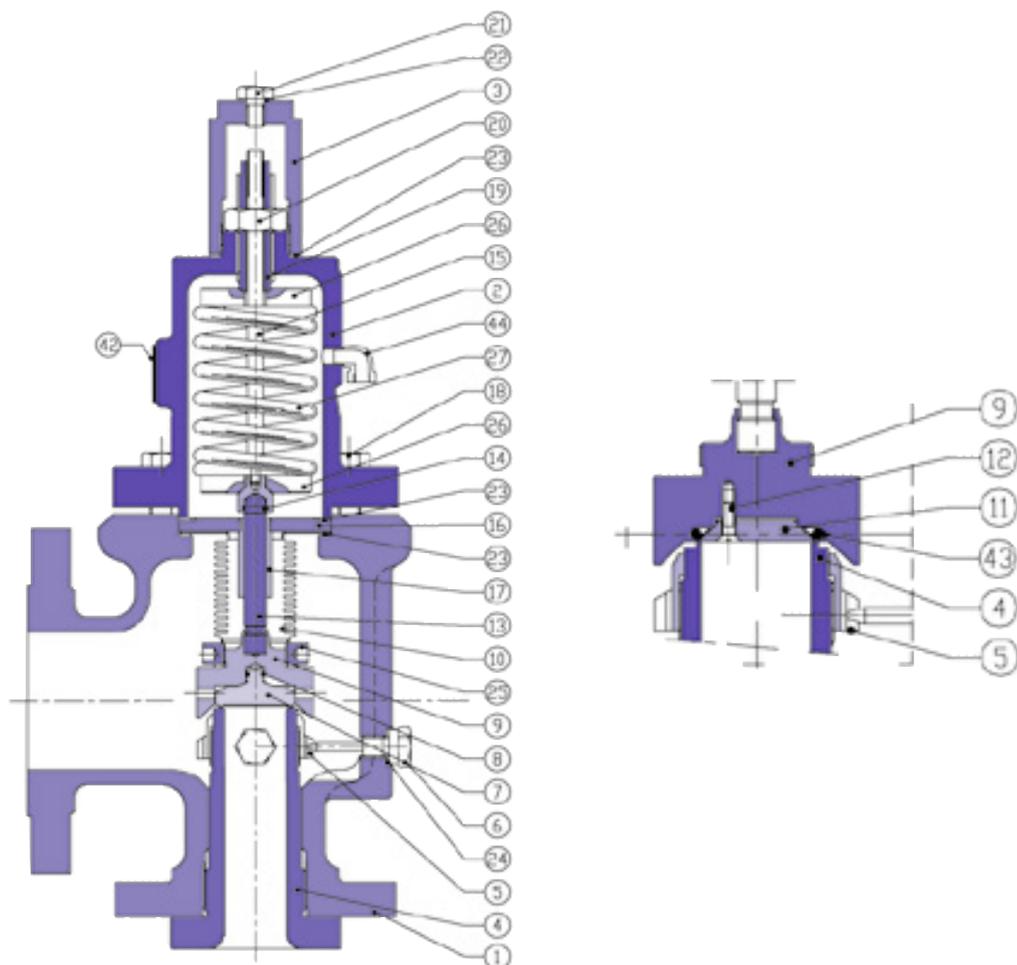

### Steam jacket and steam injection

All series 8100 safety relief valves can be fitted with a steam heating jacket.

The steam jacket is hydrotested at 1.5 times the design pressure inside the heating system. Jacket connections are threaded or flanged. The steam jacket is normally fitted with an inlet and outlet connection and a drain plug.

Steam injection nozzles can be fitted on the body of the valves. The purpose of the steam injection is to "wash" continuously the seating area of the valve in order to prevent icing or solidification of the medium.

## Lifting device Options

Plain (type C) or packed (type E or F) lifting devices are available on all types of valves. Remote air actuated lifting devices (Pneumatic actuator type P) are also available.

**Plain Type C lever (threaded)**

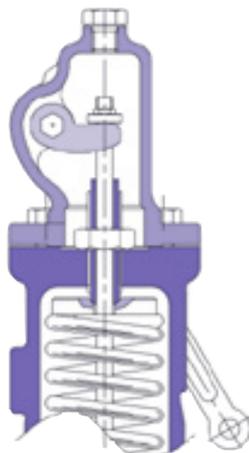

**Packed Type F Lever (threaded)**

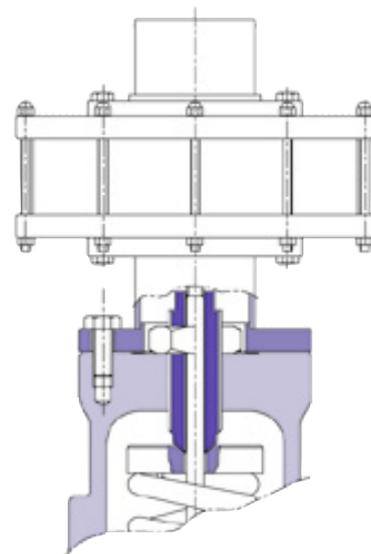

**Test Gag  
(standard feature - all cap types)**

**Packed Type E Lever  
(bolted)**

**Pneumatic Actuator Type P**

### Test gag

All Sapag safety relief valves are fitted with a test gag on top of the cap as standard. This gag is in place during transportation to avoid damaging the seating surfaces. When the gag is in place, the valve is locked in the closed position. For testing please refer to maintenance manual.

### IMPORTANT

The test gag is clearly identified by a RED TAG attached to it specifying that it MUST be removed and replaced by the plug and gasket (supplied) before valve operation. It is advised that the gag is removed just after erection on site.

**Valve designation**

or

**0 Optional additional digit for special features**

X: Additional device  
Y: Special material  
Z: Special machining.

**1 Valve type**

8100: Conventional  
8110: Soft seated  
8120: High temperature  
8180: Soft seat and bellows  
8190: Bellows  
8200: Liquid trim  
8290: Liquid trim and bellows

**2 Pressure class**

1: 150lbs or PN20  
2: 300lbs or PN50 light series \*  
3: 300lbs or PN50  
4: 600lbs or PN100  
6: 900lbs or PN150  
7: 1500lbs or PN250  
8: 2500lbs or PN420  
\* 150# body with an inlet flange machined to 300#

**3 Orifice size**

8100/8200 series:	D	H	M	R
	E	J	N	T
	F	K	P	V
	G	L	Q	W

**4 Accessories**

A: Screwed cap  
C: Screwed cap and plain lever  
E: Bolted cap and packed lever  
F: Screwed cap and packed lever  
P: Remote air actuator

**5 Material**

WCB	SGM	M1	V3
LCB	S3M	V0	WC6
L3	S4M	V1	T2
S2M	S5M	V2	

**6 Seating**

A: metal/metal  
D: stellite nozzle  
E: stellite nozzle and disc  
F: stellite disc  
K: EPT soft seat  
P: Fluorocarbon soft seat  
R: PTFE solid disc  
T: Nitrile soft seat  
V: Kalrez R soft seat

**7 Spring material**

**Note:** based on material availability, the factory reserves the right to offer a material better than specified.

\* this digit is optional; when omitted, the spring material as per the standard bill of material and/or the specified service temperature will be offered.

C: Carbon steel  
A: High temperature alloy steel  
S: Stainless steel  
PH: Precipitation hardened stainless steel  
X: High Nickel alloy  
K: Copper Nickel alloy  
T2: Tungsten high temperature alloy steel  
T9: High Tungsten alloy steel

**8 Inlet NPS or DN**

**9 Inlet and outlet flange class and finish**

**10 Outlet NPS or DN**
