FESTO

# Stopper cylinders DFSP

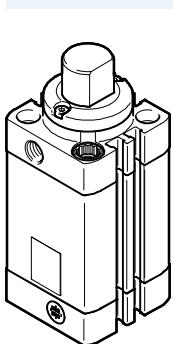

Key features

FESTO

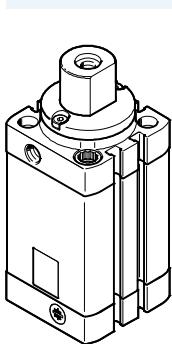

## At a glance

- Versions:
  - Trunnion
  - Trunnion with female thread
  - Roller
- Single-acting, pulling
- Double-acting with spring, pulling
- Double-acting without spring
- With or without protection against rotation
- Compact design
- Sensor slots on 3 sides
- Long service life owing to very good cushioning characteristics and sturdy piston rod guide
- Fast and simple set-up of conveyors
- Workpiece carriers, pallets and packages weighing up to 90 kg can be safely stopped
- Space-saving sensing via integrated proximity sensors

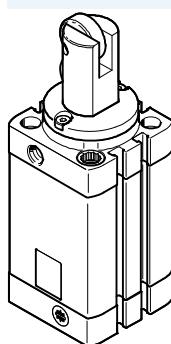

Trunnion version with/without protection against rotation

Trunnion version with female thread and with/without protection against rotation

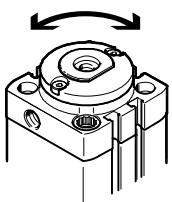

Roller version with protection against rotation

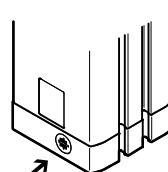

## Protection against rotation

The anti-rotation ring can be rotated by 90° by loosening the screws. The compressed air can thus be connected from all 4 sides, independent of the direction of impact.

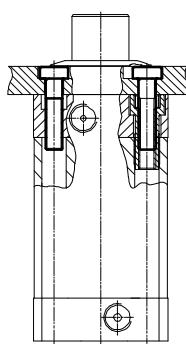

## Single-acting cylinders with spring DFSP-...-P

In the DFSP-...-P variant, the cylinder can be operated as a double-acting cylinder by removing the filter nipple in the end cap.

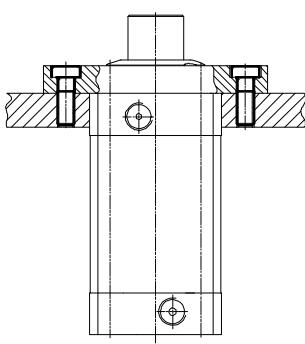

## Mounting options

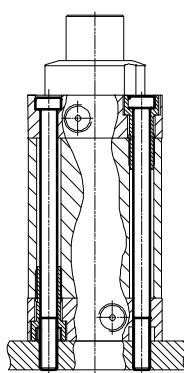

1 Direct mounting on the bearing cap

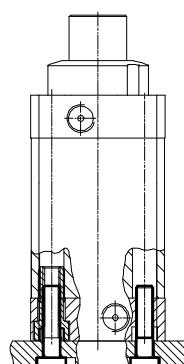

2 Direct mounting via flange mounting DAMF-F7 on the bearing cap

3 Through-hole mounting

4 Direct mounting on the end cap

## Note

All technical data refer to mounting options 1 and 2. The values can be

significantly lower for the other mounting options.

Adhere to minimum screw-in depths  
→ page 12

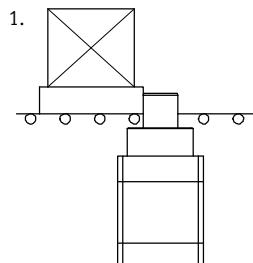

# Stopper cylinders DFSP

FESTO

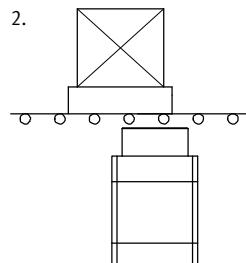

Key features

## Functional sequence

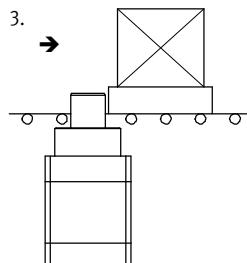

Trunnion version

1. Sudden braking of the conveyed good via the piston rod.

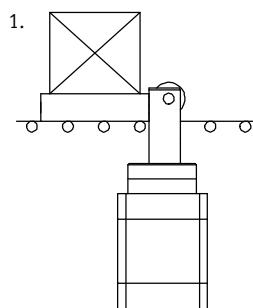

2. The conveyed good is released by actuating the cylinder. The control system must hold the piston down until the conveyed good has passed the stopper cylinder.

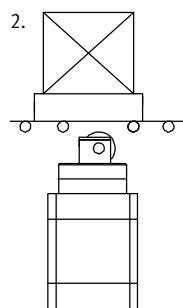

3. The piston rod then advances by means of spring force or compressed air. The next conveyed good can then be stopped.

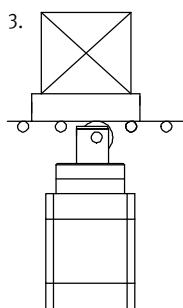

Roller version

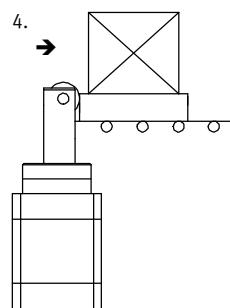

1. Sudden braking of the conveyed good via the piston rod.

2. The conveyed good is released by actuating the cylinder.

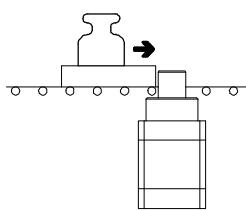

3. The piston rod then advances by means of spring force until the roller makes contact with the conveyed good. The conveyed goods continues to move forward.

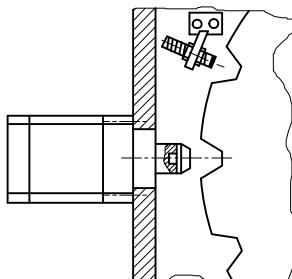

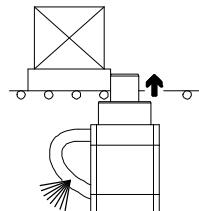

4. After the conveyed goods has passed, the piston rod advances to its end position. The next conveyed good can then be stopped.

## Application options and versions

Stopping large loads

Security

Safe stopping in the event of emergency off or pressure failure is guaranteed as a result of advancing the piston rod using spring force (single-acting/double-acting with spring).

High lateral forces on the piston rod are possible, e.g. as a result of latching or holding loads.

## Stopper cylinder with protection against rotation

For the DFSP-Q-... (with anti-rotation ring), the alignment and direction of movement of the workpiece carrier must be exactly vertical with respect to the flat impact surface of the piston rod.

Conveyed goods approaching at an angle reduce the service life of the cylinder and can lead to breakage of the anti-rotation ring.

The anti-rotation ring can be rotated by 90° into the desired position.

The compressed air can thus be connected from all 4 sides, independent of the direction of impact.

Piston Ø	16	20	32	40	50

# Stopper cylinders DFSP

FESTO

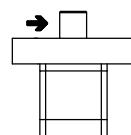

Technical data

## Permissible impact force on the advanced piston rod

"Impact force" refers to the maximum of a force-time progression (not known in detail) during the impact or cushioning phase of the moving mass. This acts perpendicularly to the axis of motion of the piston rod. If the flexible

components are considered as linear springs, a permissible impact energy can be calculated from the permissible impact force, which helps in the selection of the correct stopper. The stopper must not operate under this

force. Depending upon the type of load to be stopped, it is advisable to provide a flexible buffer to cushion the impact, reduce noise levels and to optimise the impact energy.

→ = Direction of impact force

Piston Ø	16	20	32	40	50
DFSP-...	[N]	880	1370	3270	5540
DFSP-Q-...	[N]	880	1100	3270	5540
DFSP-Q-...-R	[N]	710	840	2670	4500
					5000

## Permissible load m as a function of conveyor speed v

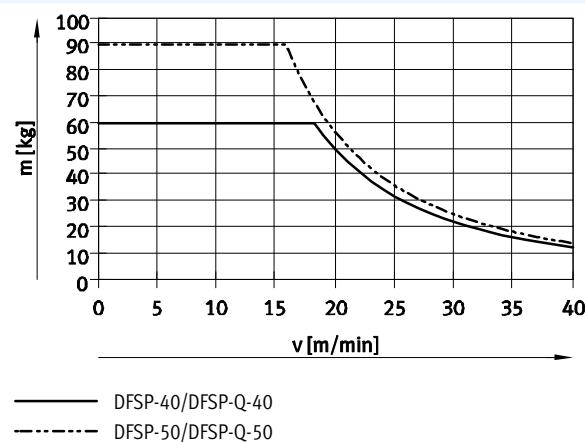

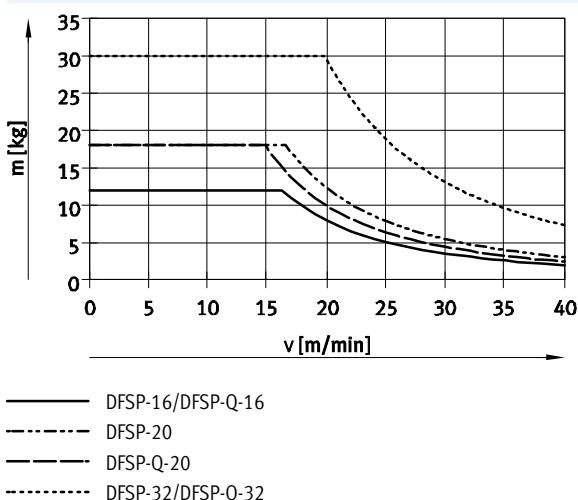

A prerequisite for the values in the graphs is an elastic buffer on the workpiece carrier with a deformation path of 1 mm.

For a smaller deformation path, the impact force is reduced.

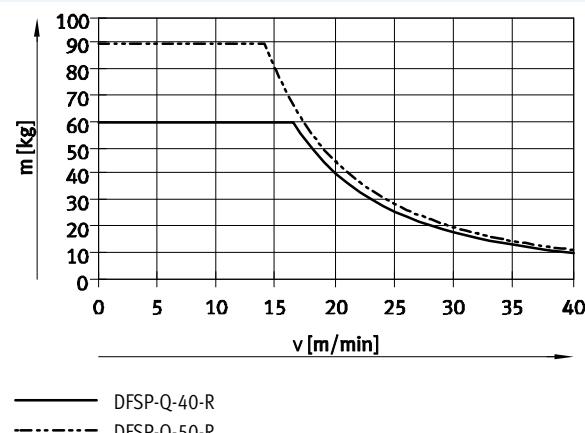

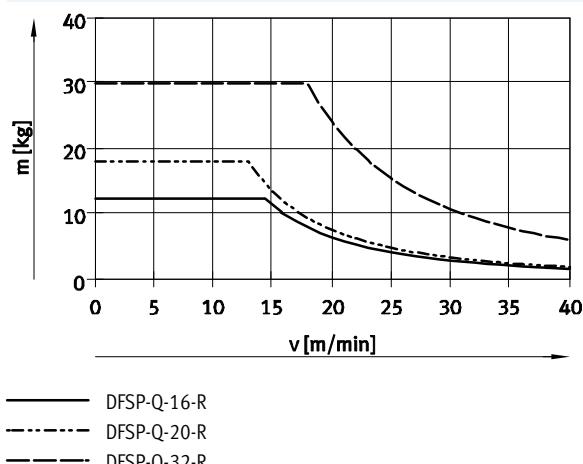

- - - Note

Selection aid → page 22

DFSP-Q-...-R – with roller

# Stopper cylinders DFSP

Technical data

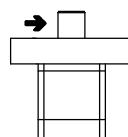

FESTO

## Permissible lateral force F on the advanced piston rod during switching operation

The "permissible lateral force during switching operation" refers to the force which is still applied perpendicularly to the direction of movement of the piston rod even after the end of

the impact or braking process, e.g. as a result of belts that are still running or the downhill force of a steep race-way. The force has a static effect. The

stopper must operate under this force. To ensure the function of the cylinder, a minimum pressure must be applied  
→ page 6

➔ = Direction of lateral force

Piston Ø	16	20	32	40	50
DFSP-...	[N]	130	210	570	950
DFSP-Q-...	[N]	130	210	570	950
DFSP-Q-...-R	[N]	100	160	420	750

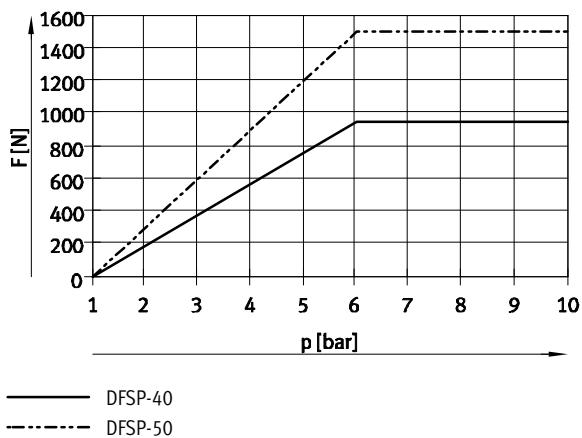

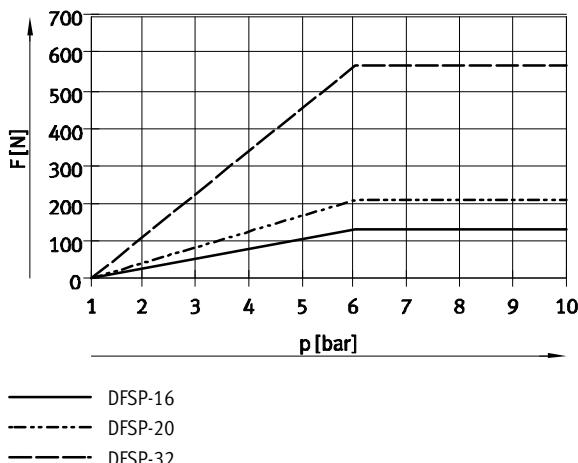

## Permissible lateral force F during the switching operation as a function of the pressure p

In order to overcome the bearing friction, sufficient compressed air must be applied when switching under pressure.

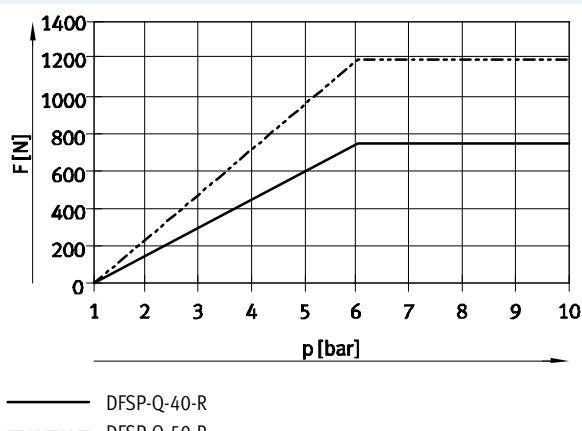

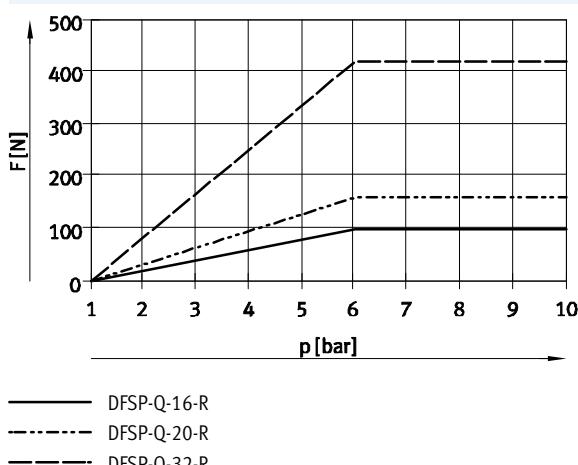

If the compressed air is below 6 bar, the following graphs and the minimum operating pressure should be observed.

- - - Note  
Selection aid ➔ page 22

DFSP-... / DFSP-Q-... – with trunnion

DFSP-Q-...-R – with roller

# Stopper cylinders DFSP

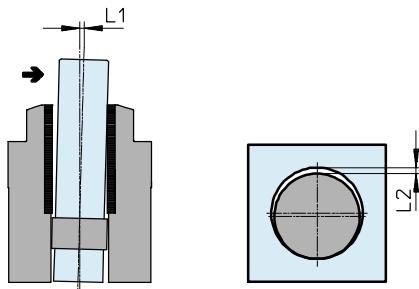

FESTO

Technical data

## Bearing clearance of the piston rod when subjected to lateral force F

The specifications are valid for the following conditions:

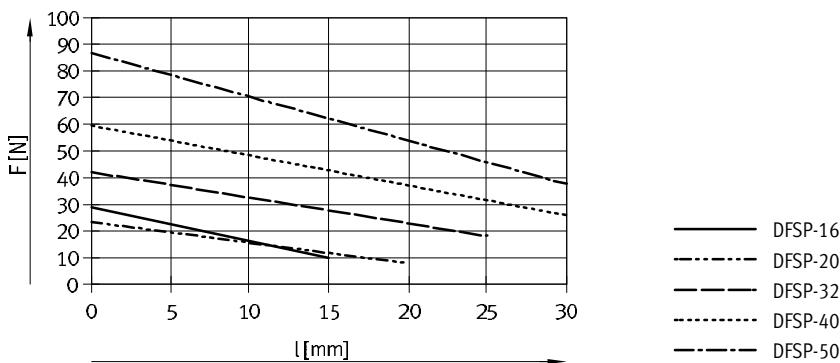

- In new condition
- Without compressed air
- Max. lateral force
- Advanced piston rod

Piston Ø	16	20	32	40	50
Dimension L1					
DFSP-...	[mm]	±0.2	±0.25	±0.25	±0.3
DFSP-Q-...	[mm]	±0.25	±0.3	±0.3	±0.35
Dimension L2					
Absolute bearing clearance	[mm]	±0.1	±0.12	±0.14	±0.14

## Spring return force F as a function of stroke l

- For single-acting cylinders, the effective force is reduced compared to the theoretical force by the values for frictional and spring force
  - The frictional force must be smaller than the spring force
  - The friction depends on the mounting position and the type of load involved
- Single-acting cylinders should as far as possible be operated without lateral forces when advancing (spring force).

Technical data

FESTO

## Selection aid

Stopping a pallet

The stopper cylinder is used to brake an individual pallet.

## Example

Given:

Friction factor  $\mu = 0.1$

Conveyor speed  $v = 15 \text{ m/min}$

Pallet with workpiece  $m = 40 \text{ kg}$

Operating pressure  $p = 6 \text{ bar}$

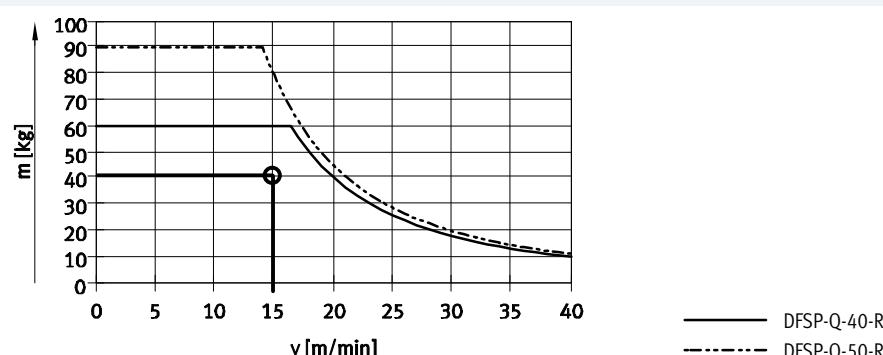

Spring travel of the pallet buffer  $s_F = 1 \text{ mm}$

Selection: stopper cylinders DFSP-Q-40-...-R

## 1. Checking the permissible load

The maximum permissible load at a conveyor speed of 15 m/min is 60 kg.

This means that the total permissible load for the pallet and the workpiece is 40 kg.

## 2. Checking the permissible lateral force during the switching operation

Lateral force  $F_Q$  = frictional force

$F_{\text{Friction}}$

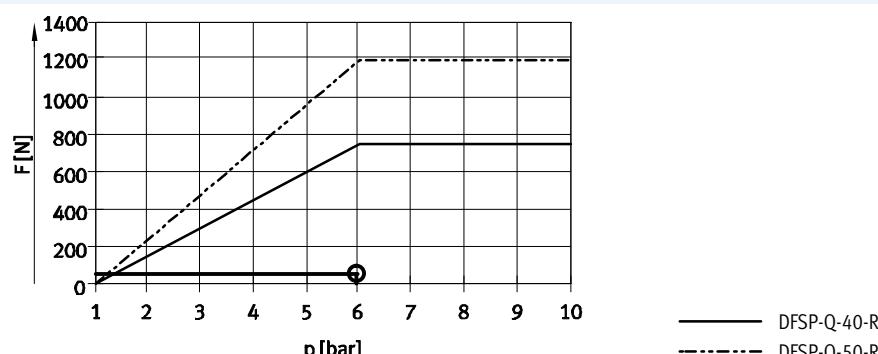

$F_{\text{Friction}} = \mu \times m \times g$

$$= 0.1 \times 40 \text{ kg} \times 9.81 \text{ m/s}^2$$

$$= \text{approx. } 40 \text{ N}$$

The maximum permissible lateral force at an operating pressure of 6 bar is 750 N.

This means that a lateral force of 40 N is permissible.

# Stopper cylinders DFSP

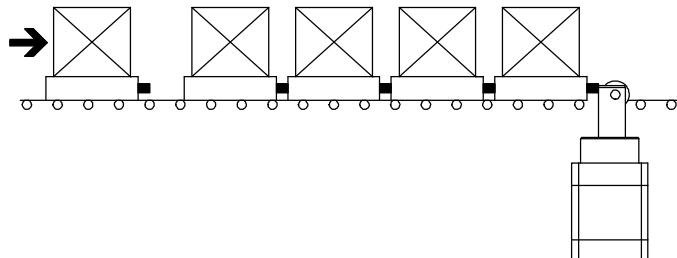

FESTO

Technical data

## Selection aid

Stopping or separating several pallets

The stopper cylinder is used to separate pallets. Further pallets accumulate behind the pallets already resting against the stopper cylinder. It is therefore vital that a buffer is mounted between the pallets (e.g. elastomer elements).

## Example

Given:

Friction factor  $\mu = 0.1$

Conveyor speed  $v = 15 \text{ m/min}$

Pallet with workpiece  $m = 40 \text{ kg}$

Operating pressure  $p = 6 \text{ bar}$

Maximum number of pallets accumulating simultaneously  $n_{\text{Group}} = 1$

Maximum number of all queued pallets  $n_{\text{Queue}} = 5$

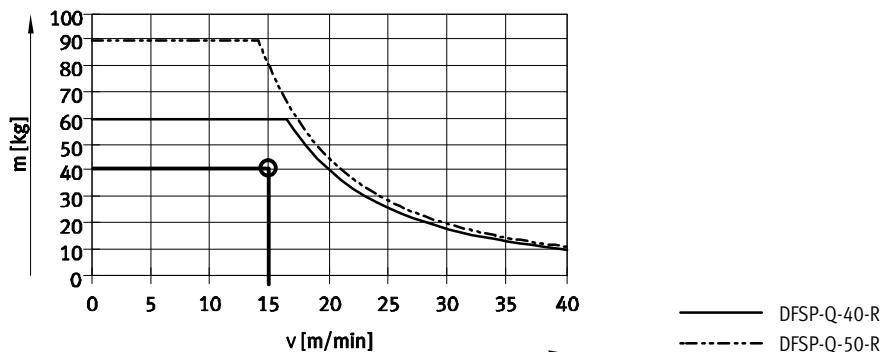

Maximum number of all advancing pallets  $n_{\text{Queue-1}} = 4$

Spring travel of the pallet buffer  $s_F = 1 \text{ mm}$

Selection: stopper cylinders DFSP-Q-40-...-R

## 1. Checking the permissible load of the first pallet

The maximum permissible load at a conveyor speed of 15 m/min is 60 kg. This means that a total load of 40 kg for the pallet and the workpiece is permissible.

## 2a. Calculation of the maximum permissible impact force when pallets accumulate behind a pallet resting against the stopper cylinder

For DFSP-Q-40-...-R, the maximum permissible impact force is 4,500 N. This means that with a total force of 2,700 N, the number of pallets is permissible.

Impact force calculation:

$$F_{\text{Impact}} = \frac{(n_{\text{Group}} \times m) \times v^2}{s_F} = \frac{(1 \times 40\text{kg}) \times (15\text{m}/60\text{s})^2}{0,001\text{m}} = \text{ca.} 2500\text{N}$$

Frictional force:

$$F_{\text{Friction}} = \mu \times (n_{\text{Queue}} \times m) \times g = 0,1 \times (5 \times 40\text{kg}) \times 9,81\text{m/s}^2 = \text{ca.} 200\text{N}$$

Max. total force:

$$F_{\text{total}} = F_{\text{Impact}} + F_{\text{Friction}} = 2500\text{N} + 200\text{N} = 2700\text{N}$$

# Stopper cylinders DFSP

Technical data

FESTO

## Selection aid

### 2b. Checking the permissible lateral force during the switching operation

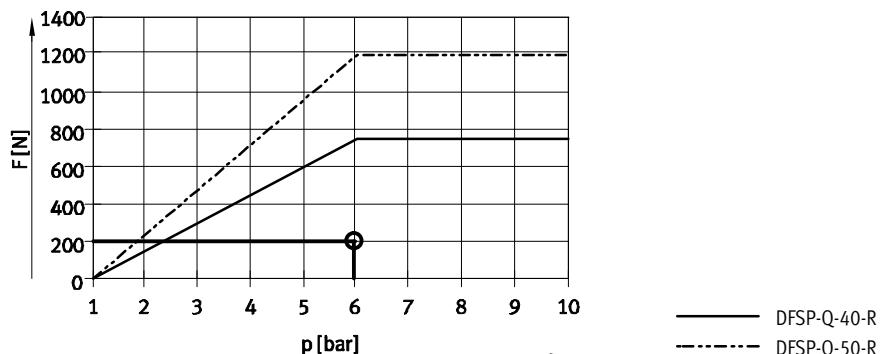

Lateral force  $F_Q$  = frictional force

$F_{Friction}$

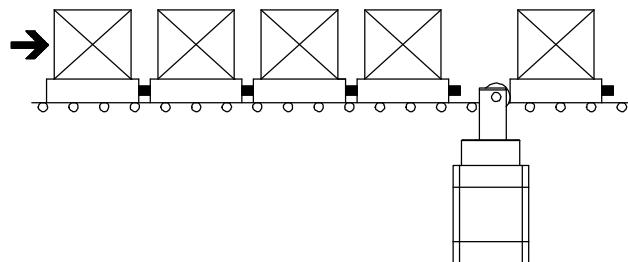

$F_{Friction} = 200 \text{ N}$

The maximum permissible lateral force at an operating pressure of 6 bar is 750 N.

This means that a lateral force of 200 N is permissible.

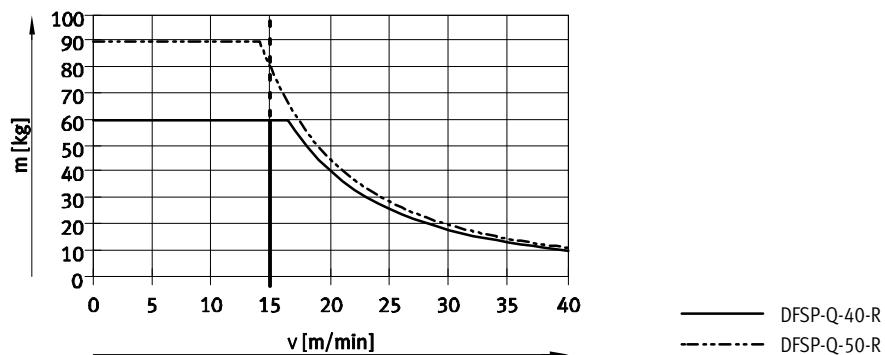

### 3. Separating and advancing the pallets

For the DFSP-Q-40-...-R, the maximum permissible load at a conveyor speed of 15 m/min is 60 kg.

The total load of the 4 pallets advancing on the stopper cylinder is 160 kg. The next largest stopper cylinder is therefore not permissible for this application as a max. of 80 kg at a speed of 15 m/min is permissible here.

Max. total load:

$$m_{\text{total}} = n_{\text{Queue}-1} \times m = 4 \times 40 \text{ kg} = 160 \text{ kg}$$

## Result

When using stopper cylinders DFSP-Q-50-...-R, max. 2 advancing pallets may accumulate simultaneously.

Max. total load:

$$m_{\text{total}} = n_{\text{Queue}-1} \times m = 2 \times 40 \text{ kg} = 80 \text{ kg}$$
