

New MSE6-C2M/D2M

Energy efficiency modules MSE6, MSE series

FESTO

Key features

Overview

The products optimise the use of compressed air as an energy medium in industrial automation technology. They are with measurement, control and diagnostic functions and support energy-efficient operation of pneumatic systems. In automatic operation, they detect standby states of the production system and shut off the

compressed air feed until it is reset by the user; the shut-off is either permanent (MSE6-D2M and MSE6-E2M) or until the pressure drops to the set-point standby pressure, which is then maintained (MSE6-C2M). This prevents unnecessary and/or increased consumption of compressed air. By monitoring the pressure drop in the

shut-off state, it is possible to detect leakages and introduce specific system maintenance actions.

The products can also be used for process monitoring by enabling pressure, flow-rate and consumption values to be transferred by a fieldbus connection directly to the machine controller, where they can be analysed. These data can be transferred to the cloud, for example via the Festo IO-Gateway, so that they can be recorded and analysed over long periods of time. The range of different equipment and functions of the three product variants are shown in the following table.

Product features			
Type	MSE6-C2M	MSE6-D2M	MSE6-E2M
Control function (energy efficiency function)	- For regulating to the adjustable normal setpoint pressure as well as automatic shut-off and subsequent regulation to the adjustable setpoint standby pressure if the flow rate drops below the limit value for a prolonged period - User-controlled shut-off and pressure regulation - Parameterisable up-rate limit for setpoint pressure	Automatic shut-off if the flow rate drops below the limit value for a prolonged period User-controlled shut-off and pressurisation	 Automatic shut-off if the flow rate drops below the limit value for a prolonged period User-controlled shut-off and pressurisation
Recording and provision of measurement data	 Output pressure Pressure change (for monitoring pressure-tightness) Flow rate Air consumption 	- Output pressure - Pressure change (for monitoring pressure-tightness) - Flow rate - Air consumption	- Output pressure - Pressure change (for monitoring pressure-tightness) - Flow rate - Air consumption
Limit monitoring	 Pressure, lower and upper limit value Pressure change in shut-off mode, upper limit value Flow rate, upper limit value 	 Pressure, lower and upper limit value Pressure change in shut-off mode, upper limit value Flow rate, upper limit value 	 Pressure, upper limit value Pressure change in shut-off mode, upper limit value Flow rate, upper limit value
Electrical inputs/outputs	 2 digital inputs 2 digital outputs Channel-based status indicator via LED Parameterisable special functions 	-	-
Fieldbus connection	- PROFINET IO via integrated fieldbus node	PROFINET IO via the fieldbus node of the CPX terminal or MSE6-C2MM actuated via a CPX extension	PROFIBUS DP via integrated fieldbus node PROFINET IO via integrated fieldbus node EtherNet/IP via integrated fieldbus node EtherCAT via integrated fieldbus node
System extension/integration	CPX extension interface row 1 for connecting a MSE6-D2M or connecting digital and analogue CPX IO modules (MSE6-C2MM only)	CPX extension interface row 2 for connection to a MSE6-C2MM or to a CPX terminal with CPX extension interface row 1	-

Key features

Functions

Standby detection, automatic shut-off and regulation of compressed air supply (MSE6-C2M only)

If parameterised accordingly, the product detects when a pneumatic system is at a standstill. The system is separated from the compressed air supply using the shut-off valve without exhausting the downstream system. This avoids additional air consumption through leakages.

The product remains shut-off until the output pressure has dropped to the parameterisable setpoint standby pressure. The shut-off valve is then

re-opened and this pressure value is maintained. This prevents the system from being exhausted unnecessarily and enables leaks to be detected by analysing the pressure drop.

If the product receives a release signal in the automatically activated shut-off/regulation mode, the shut-off valve opens, and the pressure regulator switches back to normal pressure regulation.

Standby detection and automatic shut-off of compressed air supply (MSE6-D2M/E2M only)

If parameterised accordingly, the product detects when a pneumatic system is at a standstill. The system is separated from the compressed air supply using the shut-off valve without exhausting the downstream system. This avoids additional air consumption through leakages. If the product

receives a release signal in the automatically activated shut-off mode, the shut-off valve opens, and the system is again supplied with compressed air. After exhausting via port 1, a residual pressure of < 1 bar can remain at port 2.

Manual switching on/off of the compressed air supply

The automatic shut-off and regulation of the compressed air supply can be activated and deactivated by the user. Deactivation is worthwhile during commissioning or a critical production process if automatic standby detection is difficult or not possible. This allows the shut-off valve and pressure

regulator to be directly and remotely controlled by the machine controller. Moreover, the MSE6 of the PLC can issue a "shut-off recommendation" in semi-automatic mode. The PLC program then decides whether to switch to standby mode or not.

Testing pressure-tightness

In the shut-off state, the product measures the pressure change over time

Even in well-serviced systems, the pressure falls continuously due to leakages. The fewer leakages the

system has, the slower the pressure drop will be. The measured pressure change is indicative of leakages in the system. If the parameterised limit value is exceeded, the device will output a diagnostic message.

Pressure recording

The product continuously records the output pressure, prepares the data and makes them available cyclically. To detect operating pressures that are too high or too low (MSE6-C2M/D2M only), the product offers the option of parameterising limit values for pressure. If the parameterised limit value is exceeded, the device will output a diagnostic message.

Flow recording

The product continuously records the flow rate, prepares the data and makes them available cyclically. To detect excessive flow rates, the product offers the option of parameterising the upper limit value for the flow rate. If the parameterised limit value is exceeded, the product will output a diagnostic message.

Consumption recording

The product determines the compressed air consumption by recording the flow rate. With the aid of output data, the consumption measurement can be switched on and off and the consumption value can be reset.

- ▮

Note

If there is an error (e.g. fieldbus interruption, PLC failure, no voltage) on the MSE6-D2M/E2M, then the shut-off valve switches to the initial position (pressurise) if the system parameters are set accordingly. If the valve was previously shut off, the

system is pressurised. If the system was exhausted, pressurisation takes place suddenly.

Use suitable counter measures to

prevent unintentional pressurisation of the system in the event of an error.

Key features

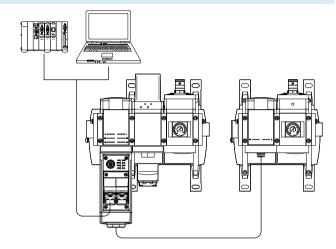

FESTO

CPX extension (MSE6-C2M-...-M and MSE6-D2M only)

The MSE6-C2M-...-M can be extended with a MSE6-D2M using the CPX interface. This combination allows for energy efficiency functions on two separate compressed air systems, activated via a common bus node. As an alternative to the MSE6-D2M, CPX IO modules can also be connected to a MSE6-C2M-...-M. A CPX terminal can also be used to activate the

MSE6-D2M instead of the MSE6-C2M-...-M.

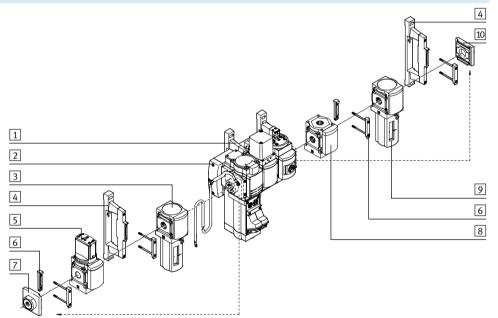

The CPX extension can be flexibly mounted on two levels (rows) situated one above the other, making it particularly suitable for tight installation conditions, e.g. in a control cabinet. For further information, please see the technical data for these modules on the following pages.

Combination of service unit components from series MS6 and MSE6

Additional service unit components of the MS6 series can be connected to the left and right of an MSE6. With this combination, the following points should be noted:

- A maximum of 10 individual devices are permitted. The MSE6-C2M counts as three devices.
- Only use the wall mounting SET MS6-WPG and module connector MS6-MV-EX. Fit a wall mounting SET MS6-WPG after every second service unit component.
- No division of modules within the MSE6.
- Remove the left connecting plate from the MSE6 and mount on the extension on the left. Do the same in the case of an extension on the right (see dashed arrows).
- Connect the earth terminal on the left-hand connecting plate to the end plate of the electrical interlinking module of the MSE6. A longer FE connection may be required.

- Energy efficiency module MSE6-C2M
- 2 Left end plate of the electrical interlinking module of the MSE6-C2M with earth terminal
- 3 Filter MS6-LF
- 4 Wall mounted SET MS6-WPG
- 5 On/off valve MS6-EM1
- 6 Module connector MS6-MV-EX
- 7 Left connecting plate
- 8 Branching module MS6-FRM
- 9 Fine filter MS6-LFM
- 10 Right connecting plate

Design

MSE6-C2M

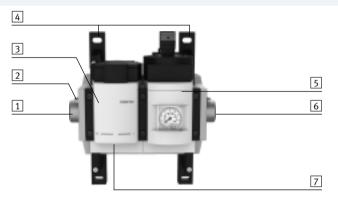

The main components of the product are: fieldbus node, flow sensor, proportional-pressure regulator and shut-off valve with pressure sensor. The fieldbus interface allows connection to a higher-order controller, e.g. a system or machine controller. Certain devices, such as the MSE6-D2M or CPX IO modules, can be connected to the CPX extension connection row 2 via the CPX extension connection row 1

- 1 Fieldbus interface
- 2 Fieldbus node
- 3 Pneumatic port 1: Compressed air inlet
- 4 Earth terminal
- 5 Flow sensor
- 6 Mounting bracket
- 7 Shut-off valve with pressure sensor and pressure gauge
- 8 Pneumatic port 2: Compressed air outlet
- 9 Proportional-pressure regulator
- 10 System supply
- Connection for electrical inputs/ outputs
- (MSE6-C2M-...-M only)

MSE6-D2M

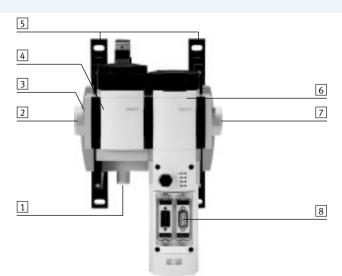

The main components of the product are: flow sensor and shut-off valve with pressure sensor. It has a CPX extension connection row 2 for connection to a decentralised, separate fieldbus node with CPX extension connection row 1, e.g. MSE6-C2M-...-M or CPX terminal.

- 1 Pneumatic port 1: Compressed air inlet
- 2 Earth terminal
- 3 Flow sensor
- 4 Mounting bracket
- 5 Shut-off valve with pressure sensor and pressure gauge
- 6 Pneumatic port 2: Compressed air outlet
- 7 CPX extension connection row 2

MSE6-E2M

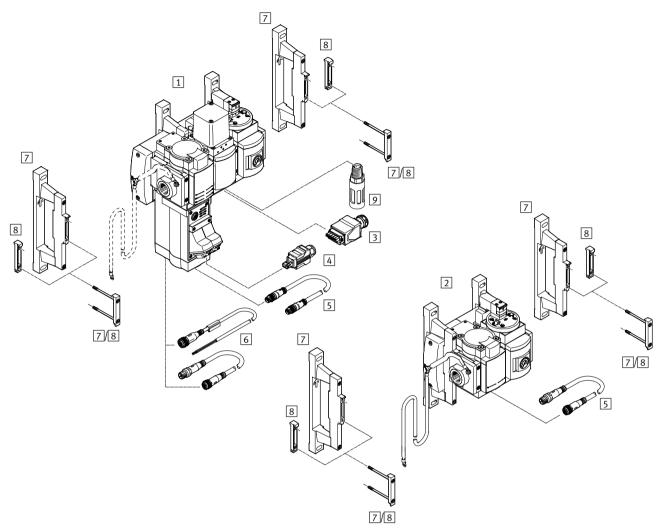

The main components of the MSE6-E2M are: shut-off valve, flow sensor, pressure sensor and bus node. The fieldbus interface allows connection to a higher-order controller, e.g. a system or machine controller.

- System supply
 Pneumatic port 1: Compressed air inlet
- 3 Earth terminal
- Shut-off valve for enabling and shutting off the system supply air
- 5 Mounting bracket
- 6 Sensor module for measuring pressure, flow rate and consumption
- 7 Pneumatic port 2: Compressed air outlet
- 8 Fieldbus interface

FESTO

MSE6-C2M-...-FB34

Consisting of

- Fieldbus node for PROFINET IO
- Flow sensor
- · Proportional-pressure regulator
- · Shut-off valve with pressure sensor and pressure gauge
- · CPX extension connection row 1 (master)
- Electrical inputs/outputs

Operating pressure 5 ... 11 bar

Temperature range 0 ... +50 °C

Key features

The MSE6-C2M is an intelligent combination of proportional-pressure regulator, on/off valve, sensors and fieldbus communication. It monitors the flow rate and, when production is not taking place, it automatically shuts off after a defined idle time. At the same time, it prevents the system pressure from falling below a defined standby pressure level. The lower pressure

level saves energy, without completely depressurising the system. This results in energy savings without affecting the availability of the machine/system.

The MSE6-C2M can automatically detect leakages occurring over time and reports these to a controller. It can be fully integrated into the machine network via PROFINET IO. All measured

values (pressure, flow rate, consumption, system parameters) are available in the PLC/cloud and can be displayed or individually further processed. The PLC can also be used to activate the two integrated digital inputs and outputs. Via the CPX extension (MSE6-C2M-...-M only), there is the option of connecting a MSE6-D2M or CPX IO modules.

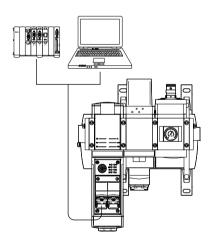

- Adjustable, regulated output
- · Automatic detection of system downtime using flow measurement
- Automatic pressure reduction without exhausting the system by regulating the standby pressure during downtimes
- · Leakage detection by evaluating the pressure drop in standby operation

Note

Pressure zones that may not be shut off or reduced must be branched off upstream of the MSE6-C2M. A signal from the PLC is required for a restart after shut-down or standby. There is no automatic restart for safety reasons.

- Adjustable pressure up-rate limit
- Digital inputs/outputs
- Direct activation/integration of 2 digital inputs (2DI) and 2 digital outputs (2DO), e.g. for valve actuation or for the sensors
- · Can be extended within the CPX system via CPX extensions

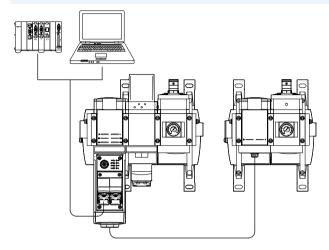

Technical data – Fieldbus node FB34 for PROFINET IO

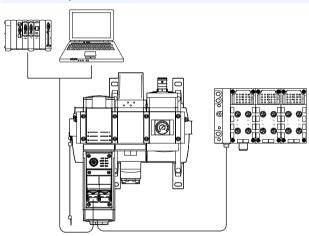

CPX extension

Extension with MSE6-D2M

- Energy efficiency function for two separate compressed air systems
- · Leakage detection
- Connection to MSE6-C2M-...-M with CPX extension
- Only one fieldbus connection required
- · Process monitoring
- Integrated pressure, flow rate and consumption measurement
- Fieldbus-controlled pressure regulation with automatic standby pressure reduction (MSE6-C2M only)
- Direct activation/integration of 2 digital inputs (2DI) and 2 digital outputs (2DO), e.g. for valve actuation or for the sensors (MSE6-C2M only)

Extension with up to 3 CPX IO modules

- Optional integration of additional digital/analogue inputs/outputs with CPX IO modules (up to 3 modules). The following electronics modules are supported → See following table
- Energy efficiency function with pressure regulation
- Leakage detection
- Only one fieldbus connection required
- Process monitoring with leakage detection

- Integrated pressure, flow rate and consumption measurement
- Fieldbus-controlled pressure regulation with automatic standby pressure reduction
- Direct activation/integration of 2 digital inputs (2DI) and 2 digital outputs (2DO), e.g. for valve actuation or for the sensors

A CPX IO module consists of the electronics module, an interlinking block and a connection block. There are several selected options available. The possible combinations of these modules as well as information and ordering data for additional accessories (end plate with CPX extension, tie rod and mounting accessories) can be found in the CPX documentation.

FESTO

MSE6-D2M

Consisting of

- · Flow sensor
- Shut-off valve with pressure sensor and pressure gauge
- CPX extension connection row 2 (slave)

Key features

The energy efficiency module MSE6-D2M automates energy saving in compressed air systems. The intelligent module fully automatic monitors the compressed air supply.

These functions are integrated into the new MSE6-D2M: automatic shut-off of the compressed air supply during breaks in production, leakage detection and process data acquisition for condition monitoring. All these functions are integrated into the new MSE6-D2M. This provides a costeffective way of implementing energy efficiency and monitoring functions without additional fieldbus nodes. After shut-off, the MSE6-D2M can automatically detect leakages

occurring over time and reports these. It can be fully integrated into the machine network via the fieldbus node of the MSE6-C2M-...-M or CPX terminal. All measured values (pressure, flow rate, system parameters, ...) are available in the PLC/cloud and can be displayed or individually further processed.

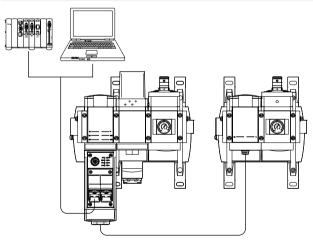

The MSE6-D2M cannot be connected directly to and operated using a controller. It must be connected as an extension to the MSE6-C2M-...-M

or to a CPX terminal with CPX extension.

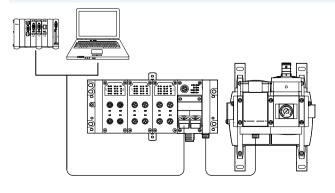

CPX extension

Extension to the MSE6-C2M-...-M

- Energy efficiency function for two separate compressed air systems
- Leakage detection
- Connection to MSE6-C2M-...-M with CPX extension
- Only one fieldbus connection required
- · Process monitoring
- Integrated pressure and flow rate measurement
- Fieldbus-controlled pressure regulation with automatic standby pressure reduction (MSE6-C2M only)
- Direct activation/integration of 2 digital inputs (2DI) and 2 digital outputs (2DO), e.g. for valve actuation or for the sensors (MSE6-C2M only)

Extension to the CPX terminal

- Energy efficiency function
- Leakage detection
- Connection to CPX terminal with CPX extension (note CPX system limits!)
- Cost-efficient solution with just one fieldbus node
- Process monitoring with leakage detection
- Integrated pressure and flow rate measurement
- Automatic detection of end of production and shut-off of compressed air supply

¹⁾ Corrosion resistance class CRC 2 to Festo standard FN 940070 Moderate corrosion stress. Indoor applications in which condensation may occur. External visible parts with primarily decorative requirements for the surface and which are in direct contact with the ambient atmospheric parts with primarily decorative requirements for the surface and which are in direct contact with the ambient atmospheric parts with primarily decorative requirements for the surface and which are in direct contact with the ambient atmospheric parts with primarily decorative requirements for the surface and which are in direct contact with the ambient atmospheric parts with primarily decorative requirements for the surface and which are in direct contact with the ambient atmospheric parts with primarily decorative requirements. $sphere\ typical\ for\ industrial\ applications.$

spriete typical for industrial applications.

For information about the applicability of the component see the manufacturer's EC declaration of conformity at: www.festo.com/sp → Certificates.

If the component is subject to restrictions on usage in residential, office or commercial environments or small businesses, further measures to reduce the emitted interference may be necessary.
